

ThermoSpot[®] Automation

Thermospot[®] Automation is a thermographic process temperature control system made up of radiometric thermal imaging cameras and ad hoc developed control software on which areas of interest, alarm and pre-alarm thresholds, temperature ranges and radiometric settings are defined. Furthermore, it is possible to display real-time temperature trend graphs, radiometric images saved on events, consult any alarms and consult production reports. The system is also set up for external communication via hardwired I/O and/or via standard communication protocols.
